

Report No. 466(55/1.0/7)

Reported Adequacy of Food Intake in India 1999-2000

NSS 55th Round
July 1999- June 2000

**National Sample Survey Organisation
Ministry of Statistics & Programme Implementation
Government of India**

August 2001

PREFACE

The National Sample Survey Organisation (NSSO) has been carrying out all-India household surveys on Consumer Expenditure and Employment & Unemployment with a large sample usually once in every five years. The sixth such survey was conducted in the 55th round (July 1999-June 2000) - which covered Non-agricultural Enterprises in the Informal Sector in addition. The schedule of enquiry on Consumer Expenditure for the survey was, more or less, similar to that adopted in previous quinquennial rounds.

The present report is the seventh in the series of reports through which the results on consumer expenditure survey are being released. It contains detailed tables giving adequacy of food intake in India. It is based on information collected on perception of households regarding sufficiency of food. It also compares adequacy of food intake with that of quinquennial surveys on consumer expenditure – NSS 38th round (January – December 1983), NSS 50th round (July 1993 – June 1994).

This report has four sections and one appendix. Section One of the report is introductory while Section Two presents Sample Design and Estimation Procedure. Section Three gives Concepts and Definitions. Section Four discusses Survey Findings. The detailed tables are provided in the Appendix.

The Field Operations Division (FOD) of the Organisation conducted the fieldwork for the survey. The collected data were processed and tabulated by the Data Processing Division (DPD) of the NSSO. The Survey Design & Research Division (SDRD) of the NSSO developed the survey design and prepared the report.

I am grateful to the Chairman and members of the Governing Council, Heads of various Divisions of the NSSO and their colleagues for the contribution made in preparing the report.

Comments/suggestions from the readers will be most welcome.

New Delhi
August 2001

N. S. Sastry
Director General & Chief Executive Officer

Table 4R:	Per 1000 distribution of households by number of calendar months of the year during which there was not enough food for its member(s) everyday - rural	A54
Table 4U:	-do- - urban	A55

Highlights

- This report presents data on perception of Indian households with regard to the availability of enough food everyday during the last year based on the results of NSS 55th round (July 1999 - June 2000).
- In rural areas, the percentage of households where all the members got enough food everyday throughout the year rose from 81.1% to 96.2% during the period 1983 to 2000.
- In urban areas, the percentage of households getting enough food everyday throughout the year increased from 93.3% to 98.6% over 1983 - 2000.
- Overall, the perception of the people in the country was that they were in general getting enough food everyday. The percentage of such households was above 96% for both rural and urban areas.
- Among all 'household types' in rural areas, the 'agricultural labour' households reported the highest proportion of 'not getting enough food'. The households belonging to the type 'self-employed in agriculture' showed the lowest percentage of 'not getting enough food' everyday.
- Among the social groups, the percentage of households not getting enough food everyday was the highest for the ST households followed by SC households in both rural and urban areas.
- As expected, the proportion of households getting enough food everyday was higher for the lower MPCE classes and lower for the higher MPCE classes in both rural and urban areas.
- The percentage of rural households not having enough food everyday was the highest in West Bengal followed by Orissa, and the lowest in States like Punjab and Rajasthan.
- In rural areas, a good proportion of households reported inadequacy of food during the months from June to September.

Section One

Introduction

1.0 The fifty-fifth round of NSS¹ was conducted during July 1999 to June 2000 for collecting information on household consumer expenditure, employment-unemployment and informal non-agricultural enterprises (other than those engaged in industrial categories of 'mining & quarrying', electricity, gas and water supply) from nationwide samples of households or enterprises. It was the sixth quinquennial survey on Consumer Expenditure² and Employment-Unemployment. The household consumer expenditure schedule was canvassed in 120309 households located in 6046 villages and 4116 urban blocks. This report is the seventh of the series of reports through which the findings of the 55th round consumer expenditure survey are being released. Through the consumer expenditure schedule, data were mainly collected on quantity and value of household consumption of different goods and services. It also collected information on *perception* regarding sufficiency of food intake from the sample households.

1.1 **Geographical Coverage:** The fifty-fifth round survey was spread over the whole of the Indian Union except Ladakh and Kargil districts of Jammu & Kashmir, 768 interior villages of Nagaland and 172 villages in Andaman & Nicobar Islands that remained inaccessible throughout the year. However, certain districts of Jammu & Kashmir viz., Doda, Anantnag, Pulwama, Srinagar, Badgam, Baramullah and Kupwara had to be excluded from the survey coverage due to unfavourable field conditions.

¹ **The National Sample Survey:** The NSS was set up in 1950, with the idea of having a permanent survey organisation to collect data on various facets of the economy through nationwide sample surveys in order to assist in socio-economic planning and policy-making. The NSS is a continuing survey in the sense that it is carried out in the form of successive "rounds", each round usually of a year's duration, covering several topics of current interest in a specific survey period. At present each NSS round reaches, at the all-India level, about 12,000 to 14,000 villages and blocks in the Central sample (covered by the Central agency NSSO) and an independent sample of about 14,000 to 16,000 villages and blocks in the State sample (covered by the Governments of various states and union territories). The entire area of the country - rural and urban - is covered, with the exception of some interior areas of Nagaland and Andaman & Nicobar Islands, and Ladakh and Kargil districts of Jammu & Kashmir.

² **Household consumer expenditure survey:** It was originally the practice to collect data on household consumer expenditure in every round of NSS, starting from the very first round (1950-51). From 1972-73, according to a decision of the Governing Council of NSSO, the consumer expenditure survey became a quinquennial feature and was also integrated with the employment and unemployment survey in the sense that a common sample of households was subjected to both the enquiries. However, independent samples of households for these two surveys was canvassed during 55th round. An annual series of consumer expenditure surveys was again launched from the 42nd round (1986-87) to fill the data gaps which planners and researchers had begun to feel. It is the larger-scale quinquennial surveys, however, which are expected to be more useful for the study of trends in the level of consumer expenditure and of the emergence of new spending patterns. So far, six quinquennial surveys of consumer expenditure have been conducted and these are the 27th, 32nd, 38th, 43rd, 50th and 55th rounds of NSS. They relate, respectively, to the years 1972-73, 1977-78, 1983, 1987-88, 1993-94 and 1999-2000.

1.2 This report presents data on the *perception* of Indian households with regard to the availability of enough food everyday, information on which was collected during the survey, as in earlier surveys on consumer expenditure. A similar report³ was brought out on the basis of results of NSS 50th round survey (July 1993 – June 1994).

With a view to studying the trend, the estimates of availability of adequate food based on the present survey have been compared with the estimates from the third and the fifth quinquennial surveys on consumer expenditure conducted during NSS 38th round (January – December 1983) and NSS 50th round (July 1993 – June 1994), respectively.

1.3 The Sample Design and Estimation Procedure followed in the NSS 55th round survey is given in Section 2. Section 3 presents important concepts and definitions adopted in the survey and used in this report. The survey findings on the *perception* of Indian households regarding sufficiency of food are presented in Section 4. The detailed tables have been provided for each State, UT and all-India in Appendix.

³ NSS Report No. 415: *Reported Adequacy of Food Intake in India, 1993-94*

Section Two

Sample Design and Estimation Procedure

2.1 Sample Design

2.1.1 General: A stratified sampling design was adopted for selection of the sample first-stage units (FSU's). The FSU's were villages (panchayat wards for Kerala) for rural areas and Urban Frame Survey (UFS) blocks for urban areas. The ultimate stage units (USU's) were enterprises for schedule 2.0 and households for schedule 1.0/ 10/ 10.1, which were selected by the method of circular systematic sampling with equal probability from the corresponding frame in the FSU. Large FSU's were subdivided into hamlet-groups (rural)/ sub-blocks (urban) that were grouped into two segments, and USU's were selected independently from each of these segments. For the purpose of systematic sampling, households in the frame of second stage stratum 2 were arranged by means of livelihood and land possessed classes for rural samples and by means of livelihood and MPCE classes for urban samples.

2.1.2 Sampling frame for first stage units: List of villages (panchayat wards for Kerala) as per 1991 Census and latest lists of UFS blocks were respectively used for selection of rural and urban sample FSU's. For selection of sample villages from the State of Jammu & Kashmir, list of villages as per 1981 Census was used as the sampling frame. It may be mentioned that all the uninhabited villages of the country as per 1991 Census, interior villages of Nagaland situated beyond 5 km of a bus route and inaccessible villages of Andaman & Nicobar Islands were left out of the survey coverage of the NSS 55th round.

2.1.3 Stratification

2.1.3.1 Rural: Two special strata were formed at the State/ UT level, viz.,

Stratum 1: all FSUs with population between 1 to 100, and

Stratum 2: FSUs with population more than 15,000.

[Note: The above two strata were spread across a given state and were not confined to any particular administrative division within the state.]

The above-noted strata of either type were formed if at least 50 such FSU's were there in the respective frames. Otherwise, they were merged with the general strata.

While forming general strata (consisting of FSU's other than those covered under strata 1 & 2), efforts were made to treat each district as a separate stratum. If limitation of sample size did not allow the formation of many strata, smaller districts within a particular NSS region were merged to form a stratum. Each district with rural population of 2 million or more as per 1991 Census (1.8 million or more as per 1981 Census in case of Jammu & Kashmir) was split into a number of strata.

2.1.3.2 **Urban** : Strata were formed within NSS Regions as follows:

Stratum number	Composition of strata by considering population of various towns as per the 1991 Census
1, 3, 5 *	'hospital area' (HA) / 'industrial area' (IA) / 'bazaar area' (BA) blocks taken together, of each single city with a population of 10 lakhs or more (there could be a maximum of 3 such cities within an NSS Region)
2, 4, 6 *	Other blocks of each single city with a population of 10 lakhs or more
7	HA or IA or BA blocks of all towns with population between 50,000 and less than 10 lakhs
8	Other blocks of all towns with population between 50,000 and less than 10 lakhs
9	HA or IA or BA blocks of all towns with population less than 50,000
10	Other blocks of all towns with population less than 50,000

* Stratum numbers 3, 4, 5 and 6 remain void if there is only one city in an NSS region with a population of 10 lakhs or more.

If sample size was not adequate for forming so many strata, all blocks of stratum 7 were merged with those of stratum 8 and all blocks of stratum 9 were merged with those of stratum 10.

2.1.4 **Sample size**: A total number of 10,384 FSU's was selected for survey in the *central sample* at all-India level (rural & urban combined) in the 55th round. For *state sample*, there was normally an equal matching. Exceptions were only for Nagaland (urban), Delhi, Goa and Maharashtra (urban) where the state sample size was higher than central sample. Sample for the whole round for each State/UT and sector (i.e., rural/ urban) was allocated equally among the four sub-rounds. Sample FSU's for each sub-round were selected afresh in the form of two independent sub-samples. The details of allocation and survey of FSUs, households and persons were given in Statement 0.

2.1.5 **Allocation of first-stage units (FSU's)**: State/ UT level rural sample size was allocated among the rural strata in proportion to population. State/ UT level urban sample size was first allocated among the three classes of towns (i.e., 10 lakh +, 50000 to less than 10 lakhs and less than 50000) in proportion to population. Then sample allocation for each of the three classes of towns, within an NSS region, was further allocated between two strata types consisting of - (i) HA/ IA/ BA blocks, and (ii) the rest, in proportion to total number of FSU's in the respective frames with double weightage given to

the first category of blocks. Stratum level allocations for both rural and urban areas of a sub-round were made in even numbers in order to facilitate selection of FSU's in the form of two independent sub-samples. Sub-sample numbers were 1 & 2 for sub-round 1; 3 & 4 for sub-round 2; 5 & 6 for sub-round 3 and 7 & 8 for sub-round 4.

2.1.6 Selection of first-stage units: For each sub-round, sample FSU's from each stratum were selected in the form of 2 independent sub-samples by following circular systematic sampling with (a) probability proportional to population for all rural strata other than stratum 1, and (b) equal probability for rural stratum 1 as well as all urban strata. Thus, stratum level allocation of FSUs was a multiple of 8.

2.1.7 Formation of hamlet-groups in large villages and number of hamlet-groups selected for survey : Depending upon the values of approximate present population (P) and approximate total number of non-agricultural enterprises (E), decision was taken to divide the FSU into a fixed number of hamlet-groups (hg's - the term applicable for rural samples) / sub-blocks (sb's - the term applicable for urban samples) as per the rules given below:

value of P	no. of hg's/ sb's formed in the FSU as per population criterion	value of E	no. of hg's/ sb's formed in the FSU as per enterprise criterion
(1)	(2)	(3)	(4)
Less than 1200	1 @	Less than 100	1 @
1200 – 1999	5	100 – 249	5
2000 – 2399	6	250 – 299	6
2400 – 2799	7	300 – 349	7
2800 – 3199	8	350 – 399	8
(and so on)		(and so on)	

@ no. of hg's/ sb's = 1 means the whole FSU is considered for listing.

[For rural areas of Himachal Pradesh, Sikkim and Poonch, Rajouri, Udhampur and Doda districts of Jammu & Kashmir, number of hg's formed in the village as per population criterion was: 1 for P < 600, 5 for P = 600 to 999, 6 for P = 1000 to 1199, 7 for P = 1200 to 1399, 8 for P = 1400 to 1599, and so on.]

The number (D) of hamlet-groups (hg)/ sub-blocks (sb) formed in the FSU was the higher of the two values as per population and enterprise criteria. If the value of P was less than 1200 (600 for certain hilly areas specified above) as well as the value of E was less than 100 for an FSU, hg/ sb formation was not resorted to and the whole FSU was considered for listing. In case hg's/ sb's were formed in the sample FSU, the same was done by more or less equalizing population.

2.1.8 Formation of segments within FSU: The hg/ sb having maximum concentration of non-agricultural enterprises was selected with certainty for listing of households/ enterprises. This hg/ sb was referred to as segment 1. From the remaining (D-1) hg's/ sb's of the FSU, 2 more hg's/ sb's were selected circular systematically and these 2 selected hg's/ sb's together were referred to as segment 2 for doing a combined listing of households/ enterprises. Thus, the listing of households/ enterprises was

done only in segments 1 and 2 of the FSU. The FSU not requiring hg/ sb formation was to be treated as segment 1.

2.1.9 Stratification of households : All the households listed in a segment (both rural & urban) were stratified into two second stage strata, viz., ‘affluent households’ (forming second stage stratum 1) and the rest (forming second stage stratum 2). In the rural sector, a maximum of ten households which were relatively affluent compared to others and possessed at least certain item(s) like motor car/ jeep, colour TV, telephone, etc. or owned land / livestock in excess of certain limits were included in second stage stratum 1. In urban sector, the households having MPCE (monthly per capita consumer expenditure) greater than a certain limit for a given town/city were treated as ‘affluent’ households for the present survey and were included in the frame of second stage stratum 1, and the rest of the urban households were included in the frame of second stage stratum 2.

2.1.10 Number of households/ enterprises selected for survey: The number of households/ enterprises selected for survey from each FSU in general is given below:

segment	number of households allotted for consumer expenditure schedule		
	second stage stratum (SSS)		
	1	2	total
(1)	(2)	(3)	(4)
FSU with hg/ sb formation:			
1	1	3	4
2	1	7	8
FSU with no hg/ sb formation:			
1	2	10	12

2.2 Estimation Procedure:

2.2.1 Approach: The estimate for a sub-round was obtained by combining the estimates of the corresponding sub-sample replicates. Similarly, an estimate for the Round was obtained by combining the four sub-round-wise estimates.

2.2.2 The following notations are being used in this section:

- a = subscript for the a-th stratum
- r = subscript for the r-th sub-sample replicate (r = 1,2,...,8)
- q = subscript for the q-th sub-round (q = 1,2,3 and 4)
- f = subscript for the f-th sampled village/ block as First Stage Unit (FSU)
- s = subscript for the s-th segment of sampled village/ block (s = 1 and 2)
- c = subscript for the c-th 2nd stage stratum of households in the sampled village/ block (c = 1,2)
- j = subscript for the j-th sampled household

- p = subscript for pooled estimate
z = size used for selection of an FSU from the sampling frame
Z = total of sizes in the sampling frame for the stratum
[Note: For urban sector, z=1 and Z=N which is the total number of UFS blocks (FSU's) in the frame.]
n = number of sampled FSU surveyed within a stratum and a sub-sample replicate (including zero cases but excluding casualty and not reported cases) and used for tabulation
L= number of sub-sample replicates surveyed and used for tabulation
D = number of hamlet-groups/ sub-blocks formed in rural/ urban sampled FSU
H = total number of households listed in the appropriate frame
h = number of sampled households surveyed and used for tabulation from the frame
E = total number of enterprises listed in the appropriate frame
e = number of sampled enterprises surveyed and used for tabulation from the frame
y, x = value of characteristic y, x obtained in the sample
 \bar{y}, \bar{x} = estimated value of aggregate of characteristic y, x obtained from the sample.

2.2.3 ESTIMATES OF AGGREGATE: In the formulae given in this section, \bar{y} is the estimate of aggregate of any characteristic y for a given stratum (a), and for a particular sub-round (q) and sub-sample replicate (r). These formulae are provided for the general case of FSU's having two segments 1 and 2. For the FSU's requiring no hg/ sb formation, the formula is identical to that given for segment 1 while the contribution from segment 2 is taken as zero for estimating a characteristic of household from a given 2nd stage stratum (c) in the selection frame

$$\text{Rural : } \hat{Y}_c = \frac{Z}{n} \sum_{f=1}^n \frac{1}{Z_f} \sum_{s=1}^2 B_{fsc} \sum_{j=1}^{h_{fsc}} y_{fscj} \quad (1)$$

$$\text{Here } B_{fsc} = \frac{H_{fsc}}{h_{fsc}}, \text{ for segment 1 (s=1)} \quad \text{and} \quad B_{fsc} = \frac{D_f - 1}{2} \times \frac{H_{fsc}}{h_{fsc}}, \text{ for segment 2 (s=2)}.$$

$$\text{Urban: } \hat{Y}_c = \frac{Z}{n} \sum_{f=1}^n \sum_{s=1}^2 B_{fsc} \sum_{j=1}^{h_{fsc}} y_{fscj} \quad \dots(2)$$

$$\text{Here } B_{fsc} = \frac{H_{fsc}}{h_{fsc}}, \text{ for segment 1 (s=1)} \quad \text{and} \quad B_{fsc} = \frac{D_f - 1}{2} \times \frac{H_{fsc}}{h_{fsc}}, \text{ for segment 2 (s=2)}.$$

Note: For tabulating any characteristic from this detailed schedule $\hat{Y} = \sum_c \hat{Y}_c$ is to be used.

2.2.3.1 COMBINED ESTIMATE FROM SUB-SAMPLES: In the previous section, the estimate of a characteristic \hat{Y} as obtained for a stratum (a), for a particular sub-round (q) and a sub-sample replicate (r), actually represent \hat{Y}_{aqr} . The combined /pooled estimate for a particular stratum and a particular sub-round is computed as the average of sub-sample replicate estimates and is given below:

$$\hat{Y}_{aq} = \frac{1}{L} \sum_{r=1}^L \hat{Y}_{aqr} \quad \dots(3)$$

2.2.3.2 ESTIMATE OF AGGREGATES FOR A SUB-ROUND AT STATE/ UT/ REGION

LEVEL: If \hat{Y}_{qr} be the State/ UT/ Region level aggregate from the r-th sub-sample replicate and q-th sub-round, and \hat{Y}_{qp} , the combined/ pooled estimate of the aggregate based on the whole sample, for a given sub-round q, then

$$\hat{Y}_{qr} = \sum_a \hat{Y}_{aqr} \quad \dots(4)$$

based on sub-sample replicate group r, and

$$\hat{Y}_{qp} = \frac{1}{L} \sum_{r=1}^L \hat{Y}_{qr} \quad \dots(5)$$

based on all sub-sample replicates.

2.2.3.3 ESTIMATES OF AGGREGATE FOR THE ROUND (i.e., taking all the 4 sub-rounds together) AT STATE/ UT/ REGION LEVEL:

The estimates of aggregates for the whole round are computed as the simple average of the sub-round estimates derived in section 2.2.2, and are given below:

$$\hat{Y}_r = \frac{1}{4} \sum_{q=1}^4 \hat{Y}_{qr} \quad \dots(6)$$

based on sub-sample replicate 1 and 2*and

$$\hat{Y}_p = \frac{1}{4} \sum_{q=1}^4 \hat{Y}_{qp} \quad \dots(7)$$

based on whole sample.

**Note: In the Round, sub-samples 1, 3, 5 and 7 (in sub-rounds 1 to 4) are combined together to form sub-sample replicate 1 (annual) while sub-samples 2, 4, 6 & 8 (in sub-rounds 1 to 4) are combined together to form sub-sample replicate 2 (annual). This has been followed in the remaining sections also. Stratum level estimate for the Round is obtained similarly.*

2.2.4 ESTIMATES OF RATIO: If \hat{X} and \hat{Y} be the State/ UT/ Region level aggregate estimate corresponding to variables x and y, then the estimate of ratio is given below:

$$\hat{R}_r = \frac{\hat{Y}_r}{\hat{X}_r} \quad \dots(8)$$

based on sub-sample group r, and

$$\hat{R}_p = \frac{\hat{Y}_p}{\hat{X}_p} \quad \dots(9)$$

based on the whole sample.

The formulae for \hat{X} are obtained similarly by replacing \hat{Y} by \hat{X} and y by x in the above formulae stated in previous sections.

Note: Estimates for the sub-round \hat{R}_{qr} and \hat{R}_{qp} have been obtained by replacing \hat{Y}_r and \hat{Y}_p by \hat{Y}_{qr} and \hat{Y}_{qp} , respectively and \hat{X}_r and \hat{X}_p by \hat{X}_{qr} and \hat{X}_{qp} , respectively.

Statement 0: Number of villages/ blocks allotted and surveyed and number of households and persons surveyed

State/UT	no. of villages		no. of blocks		no. of households surveyed		no. of persons surveyed

Section Three

Concepts and Definitions

3.0 The concepts and definitions followed in the sixth quinquennial survey on household consumer expenditure are more or less the same as in the earlier rounds. The concepts and definitions of the terms used or relevant in the report are given below.

3.1 **Household:** A group of persons normally living together and taking food from a common kitchen constitutes a household. The word 'normally' means that temporary visitors are excluded but temporary stay-aways are included. Thus, a son or daughter residing in a hostel for studies is excluded from the household of his/her parents, but a resident employee or resident domestic servant or paying guest (but not just a tenant in the house) is included in the employer/host's household. 'Living together' is usually given more importance than 'sharing food from a common kitchen' in drawing the boundaries of a household in case the two criteria are in conflict; however, in the special case of a person taking food with his family but sleeping elsewhere (say, in a shop or a different house) due to space shortage, the household formed by such a person's family members is taken to include the person also. Each inmate of a mess, hotel, boarding and lodging house, hostel, etc., is considered a single-member household except that a family living in a hotel (say) is considered to be one household only; and the same applies to residential staff of such establishments.

3.2 **Household size:** The size of a household is the total number of persons in the household.

3.3 **Household consumer expenditure:** The expenditure incurred by a household on domestic consumption during the reference period is the household's consumer expenditure. The household consumer expenditure is the total of the monetary values of consumption of various groups of items, namely, (i) food, *pan* (betel leaves), tobacco, intoxicants and fuel & light, (ii) clothing and footwear and (iii) miscellaneous goods and services and durable articles.

3.4 For groups (i) and (ii), the total value of consumption is derived by aggregating the monetary value of goods actually consumed during the reference period. An item of clothing and footwear is considered to be consumed if it is brought into maiden or first use during the reference period. The consumption may be out of (a) purchases made during the reference period or earlier; (b) home grown stock; (c) receipts in exchange of goods and services; (d) any other receipt through gift, charity, borrowing; and (e) free collection. Home produce is evaluated at the ex farm or ex factory prices. For evaluating the consumption of the items of group (iii), i.e., items categorised as miscellaneous goods and services and durable goods, a different approach is followed. In this case, the expenditure made during the reference period for the purchase of goods and services is considered to be consumption.

3.5 It is pertinent to mention here that the consumer expenditure of a household on food items relates to the actual consumption by the normal resident members of the household and also by the guests, whether during ceremonies or otherwise. To avoid double counting, transfer payments like charity, loan, advance, etc., made by the household are not considered consumption for items of groups (i) and (ii), since transfer receipts of these items have been taken into account. However, the item 'cooked meals' is an exception to the rule. Meals prepared in the household kitchen and provided to the employees and/or others would automatically get included in domestic consumption of employer (payer) household. There is a practical difficulty in estimating the quantities and values of individual items used for preparing the meals served to employees or to others. Thus, to avoid double counting, cooked meals received as perquisites from employer household or as gift or charity are not recorded in the recipient household. As a general principle, cooked meals purchased from the market for consumption of the normal resident members and of guests and employees are recorded in the purchaser household.

3.6 This procedure of recording cooked meals served to others in the expenditure of the serving households only leads to bias-free estimates of average per capita consumption as well as total consumer expenditure. However, as the proportions of donors and recipients of free cooked meals are likely to vary in opposite directions over the expenditure classes, the nutritional intake derived from the consumer expenditure survey data may present a somewhat distorted picture. These derived nutrition intakes may get inflated for the rich (net donors) and somewhat understated for the poor (net recipients). This point has to be kept in mind while using the NSS consumer expenditure data for any studies relating to the nutritional status of households.

3.7 **Reference period:** Reference period means the period of time for which data on consumption was collected. The reference period used for the survey was a "moving" one, varying from household to household, although it was a fixed length of period. During the 55th round of NSS, information on consumption of food, pan, tobacco & intoxicants was collected independently for two different reference periods of last 30 days and last 7 days from the same households. For items of clothing, footwear, durable goods, education and medical (institutional) expenses, data were collected for the reference period of "last 365 days" preceding the date of survey. For the remaining items, a reference period of "last 30 days" preceding the date of survey was used. However, the monthly per capita consumption expenditure (MPCE) classes in this report are based on data collected for "last 365 days" for clothing, footwear, durable goods, education and medical (institutional) expenses and for "last 30 days" for the rest of the items.

3.8 **Sector :** The word "sector" is used for the rural-urban demarcation: rural and urban are the only two sectors as far as this report is concerned.

3.9 **Major states :** This refers to the following states of India: Andhra Pradesh, Assam, Bihar, Gujarat, Haryana, Karnataka, Kerala, Madhya Pradesh, Maharashtra, Orissa, Punjab, Rajasthan, Tamil Nadu, Uttar Pradesh and West Bengal.

3.10 **Monthly per capita consumer expenditure (MPCE):** For a household, this is its last 30 days' total consumer expenditure divided by its size. A person's MPCE is understood as that of the household to which he or she belongs.

3.11 **MPCE class:** The MPCE classes are normally revised during quinquennial surveys of Consumer Expenditure. Usually, 12 MPCE classes are formed from a table giving estimated cumulative percentage frequency distribution of persons by MPCE for each sector separately and also combinedly. The upper limits of these classes correspond broadly to cumulative frequencies 5%, 10%, 20%, 30%, 40%, 50%, 60%, 70%, 80%, 90%, 95% and 100% of the population. The class limits are given below:

sl. no.	rural (in Rs)	urban (in Rs)
1	0 – 225	0 - 300
2	225 – 255	300 - 350
3	255 – 300	350 - 425
4	300 – 340	425 - 500
5	340 – 380	500 - 575
6	380 – 420	575 - 665
7	420 – 470	665 - 775
8	470 – 525	775 - 915
9	525 – 615	915 - 1120
10	615 – 775	1120 - 1500
11	775 – 950	1500 - 1925
12	950+	1925+

The MPCE classes have been assigned to the households on the basis of data with reference period of “365 days” for items of education, medical (institutional) expenses, clothing, footwear and durable goods and of “last 30 days” for the rest of the items.

3.12 **Household type:** Rural households were classified into five types and urban households into four types on the basis of the occupations pursued by the household members. The five types of rural households are *self-employed in non-agriculture, agricultural labour, other labour, self-employed in agriculture, and other households*. The four types of urban household are: *self-employed, regular wage / salary earner, casual labour, and other households*.

3.13 The “type” of a household was determined as follows.

Rural

A household was classified as “agricultural labour”, if its income from that source was 50% or more of its total income. The same criterion was followed to classify a household as “self-employed in agriculture”. A household was classified as “self-employed in non-agriculture” if its income from that source was greater than that from rural labour as well as that from all other gainful sources put together. If a household was not one of these three types but its income from

total rural labour was greater than that from all self-employment and from other gainful sources, it was classified as “other labour”. The remaining households were classified as “other households”.

Urban

A household was classified as “self-employed”, “regular wage or salary earning”, or “casual labour”, according to the major sources of its income from “gainful employment” during the 365 days preceding the date of survey. A household not having any income from gainful employment was classified under “others”.

3.14 Social group: Three social groups were distinguished - scheduled tribe, scheduled caste, and other households. In case different members of a household belong to different social groups, the group to which the head of the household belongs has been considered as the social group of the household.

3.15 Land possessed: The area of land possessed (in hectares) includes land owned, land leased in, and (encroached) land neither owned nor leased in, but excludes land leased out. The size classes of land possessed are:

- < 0.01 ha
- 0.01– 0.40 ha
- 0.41-1.00 ha
- 1.01-2.00 ha
- 2.01-4.00 ha
- 4.01+

3.16 Perception of household regarding sufficiency of food: In the Household Consumer Expenditure survey two questions were asked from the sample households. They were: 1. Do all members of your household get enough food everyday? 2. If no, during which calendar months did you/ all members of household not have enough food everyday? However, the households whose reported consumption would obviously indicate that they get sufficient food to eat were not asked these questions. There was a provision in the schedule to identify such households. The expression ‘getting enough food everyday’ - as used in common parlance, conveys that the concerned person gets, by and large, sufficient food to eat. Here, calendar months refer to the last 12 months preceding the date of survey.

Section Four

Survey Findings

4.0 This section brings out the summary of findings from the information on perception of getting enough food everyday throughout the year collected during the sixth quinquennial survey on Household Consumer Expenditure conducted in NSS 55th round (July 1999 – June 2000). Here, 'year' refers to the twelve calendar months preceding the date of survey. Since the information collected was relating to the perception of the informants, it may not accurately reveal the level of inadequacy of food prevailing in the country. In psychology, one important conclusion is: "*We perceive what we want, not what it is.*" So the perception varies from person to person. A person not being able to consume food of his/her taste may report that he/she did not get enough food everyday throughout the year. On the other hand, a person who normally consumes only *dal-roti* may perceive that he/she gets enough food everyday. Anyway, this section gives a summary of the feelings of the people about whether they are getting adequate food or not during the year.

The results at the national level have been compared with those from past quinquennial surveys on consumer expenditure NSS 50th round (July 1993 – June 1994) and NSS 38th round (January – December 1983). Further, attempts are made to find whether there was any impact on the results for different household (occupational) types, social groups or MPCE classes. Also, inter-State variation in availability of adequate food has been studied.

4.1 **Temporal Variation:** The distributions of households by food availability status for NSS 38th, 50th and 55th rounds are given in Statement 1. The proportions of 'not recorded' cases are also included in the Statement. As the proportion of 'not recorded' cases remained more or less the same, the figures for different NSS rounds are comparable.

In **rural** areas, the percentage of households where all the members got enough food everyday throughout the year rose from 81.1% to 96.2% during the period from 1983 to 2000. The percentage of households with at least one of the household members not getting enough food everyday during **some months** of the year fell from 16.2% to 2.6% during 1983 – 2000. The percentage of households with at least one member not getting enough food everyday **in all the months** of the year also declined from 2.4% to 0.7% over the period from 1983 to 2000.

In **urban** areas also, the pattern of availability of enough food everyday to the members of households was the same. The percentage of households getting enough food everyday throughout the year increased from 93.3% to 98.6% over 1983 - 2000.

Figure 1R: Percentage distribution of households by food availability status - rural India

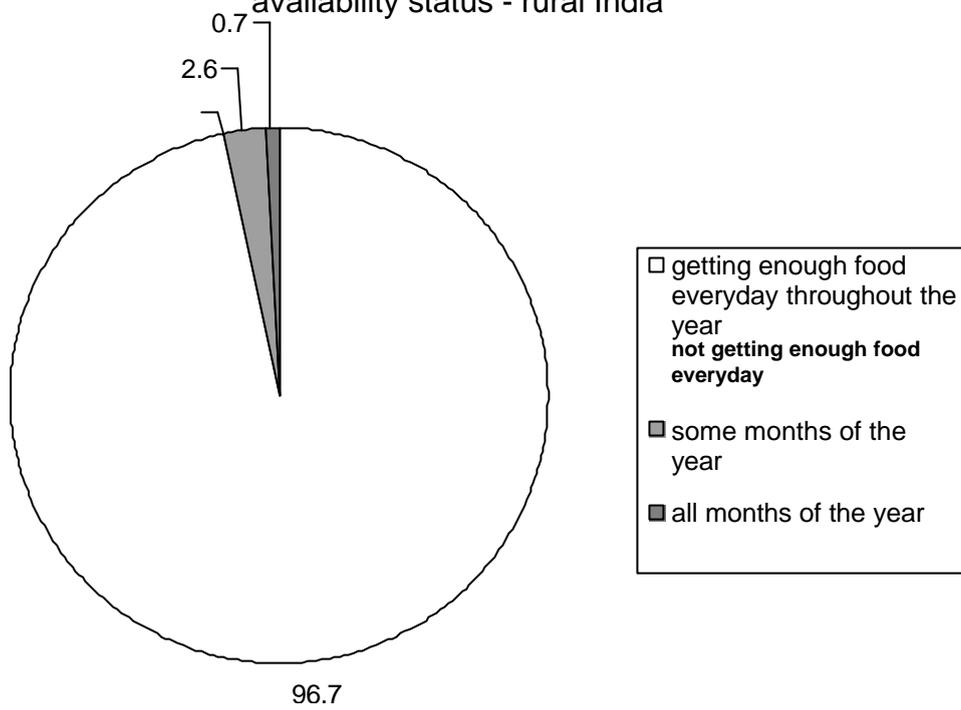

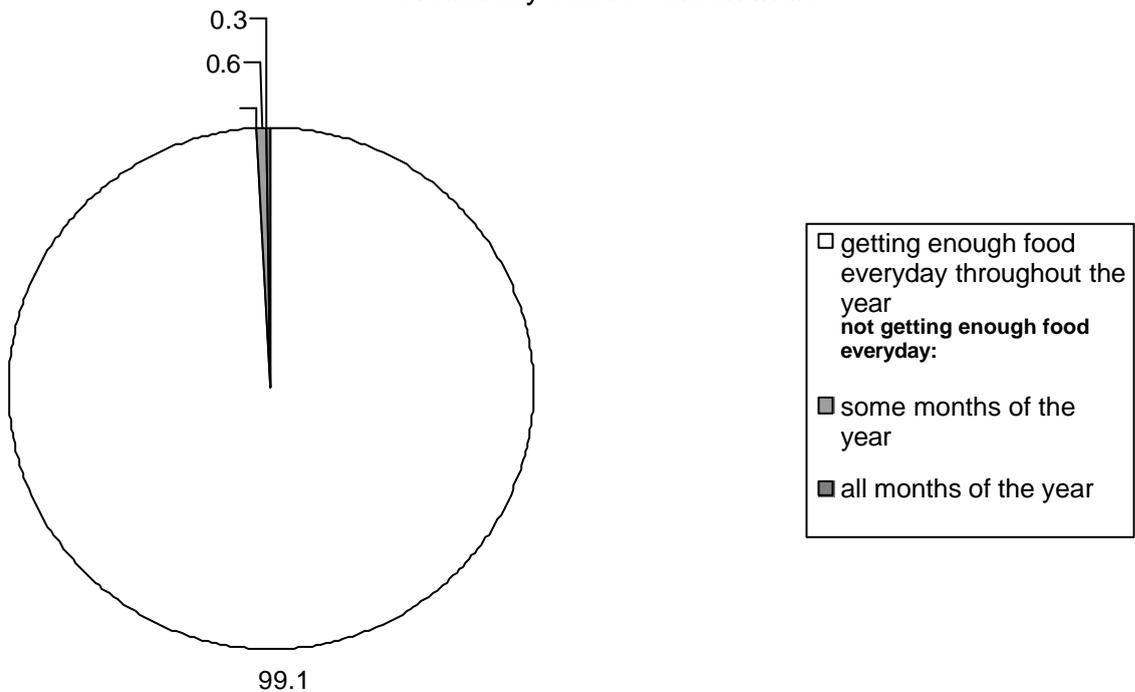

Figure 1U: Percentage distribution of households by food availability status - urban India

Statement 1 : Percentage distribution of households by food availability status
all-India

sector/round	% of households				not recorded	All
	getting enough food everyday throughout the year	not getting enough food everyday				
		some months of the year	all months of the year			
(1)	(2)	(3)	(4)	(5)	(6)	
						Rural
NSS 55 th round (July 1999 – June 2000)	96.2	2.6	0.7	0.5	100	
NSS 50 th round (July 1993 – June 1994)	94.5	4.2	0.9	0.4	100	
NSS 38 th round (Jan – Dec 1983)	81.1	16.2	2.4	0.3	100	
						Urban
NSS 55 th round (July 1999 – June 2000)	98.6	0.6	0.3	0.4	100	
NSS 50 th round (July 1993 – June 1994)	98.1	1.1	0.5	0.3	100	
NSS 38 th round (Jan – Dec 1983)	93.3	5.6	0.8	0.3	100	

The percentage of households not getting enough food everyday for **some months** of the year also decreased from 5.6% to 0.6% over 1983 – 2000. While calculating the percentage, a household is considered not getting enough food everyday if at least one of the members of the household did not get so. The percentage of households not getting enough food everyday during **all months** of the year declined from 0.8% to 0.3%.

Overall, the perception of the people in the country was that in 1999 - 2000 they were in general getting enough food everyday throughout the year. The percentage of such households was above 96 for both rural and urban areas.

4.2 Food adequacy by household type: The distributions of households by food availability status for different household types at all-India level are given in Statements 2R and 2U for rural and urban areas, respectively. Statement 2R shows that households belonging to household type ‘agricultural / other labour’ not getting enough food everyday during the year was relatively high compared to other household types. The households belonging to the type ‘self-employed in agriculture’ had the lowest percentage of not getting enough food everyday.

Statement 2U shows that the percentage of households belonging to ‘casual labour’ not getting enough food everyday was relatively high compared to other types of households. It is the regular wage/salary-earning households for which the proportion of households getting adequate food was the highest.

Statement 2R: Per 1000 distribution of households by food availability status for each household type

all-India		rural			
household type	no. per 1000 of households				
	getting enough food everyday throughout the year	not getting enough food everyday		not reported	all
		some months of the year	all months of the year

all groups	962	26	7	5	1000

(Contd.)

Statement 3: Per 1000 distribution of households by food availability status for each social group

all-India

social group	no. per 1000 of households				
	getting enough food everyday throughout the year	not getting enough food everyday		not reported	all
		some months of the year	all months of the year		
(1)	(2)	(3)	(4)	(5)	(6)
					urban
schedule tribe	948	26	18	8	1000
schedule caste	975	14	6	6	1000
other backward class	988	6	3	3	1000
others	991	3	2	4	1000
not recorded	924	0	0	76	1000
all groups	986	6	3	4	1000

Further, detailed results on distribution of households by food availability status for each household type for rural and urban areas of each State, UT and all-India are given in Appendix Tables 1R & 1U.

4.3 Food adequacy by social group: The distributions of households by food availability status for different social groups for rural and urban areas at all-India level have been given in Statement 3. It appears that the percentage of households not getting enough food everyday was the lowest for ST households followed by SC households in both rural and urban areas. This is also generally true for households not getting enough food everyday for some months of the year.

Further, the detailed results on distribution of households not getting enough food everyday by food availability status for each social group for rural and urban areas of each State, UT and all-India are given in Appendix Tables 2R & 2U.

4.4 Adequacy of food by MPCE class: Statement 4 gives the proportion of households not getting enough food everyday for each MPCE class at all-India level for rural and urban areas, separately. It shows, as expected, that the proportion of households not getting enough food everyday was relatively high for the lower MPCE classes and low, almost zero, for the higher MPCE classes in both rural and urban areas. The drop in this proportion over MPCE classes was more rapid for urban areas. The calendar months in which the incidence of not getting enough food everyday was high were June, July, August and September for rural India. In urban India, the same calendar months showed relatively high proportion of households not getting enough food everyday but only for a few MPCE classes at the bottom.

The information corresponding to Statement 4 for all the States and union territories are provided in Tables 3R and 3U.

4.5 Food adequacy by calendar month: Statement 5 gives the distribution of households not getting enough food everyday by number of calendar months for rural and urban areas of each major State and all-India. It may be seen that the percentage of **rural** households not getting enough food everyday for 1 to 3 months during the reference year

was the highest for West Bengal (7%), followed by Orissa (6%) and Bihar (4%) among the major States. If we examine similar percentages for 'all the months' of the year, then also these three States show high percentages but Assam tops the list with a figure of 4%. In **urban** areas too, the percentage of such households under 1-3 months was the highest (1%) in these three States. Only additions to the list are Kerala (1%) and Madhya Pradesh (1%). For the urban areas the percentage of households not having enough food everyday during all months of the year was high for Orissa (1.6%), Bihar (1.1%) and West Bengal (0.9%), and zero for only two States – Punjab and Rajasthan – among the 15 major States.

The percentage of households not getting enough food everyday during all the months of the year were the lowest, near zero, for states like Punjab, Haryana, Karnataka, and Rajasthan, in both rural and urban areas.

The results for all States, UTs and all-India are provided in Appendix Tables 4R and 4U for rural and urban areas, respectively.

Statement 4: Number per 1000 of households not getting enough food everyday in different calendar months of the year by MPCE class
