THE AGED IN INDIA A Socio-Economic Profile

NSS FIFTY-SECOND ROUND

July 1995 – June 1996

NATIONAL SAMPLE SURVEY ORGANISATION

DEPARTMENT OF STATISTICS

MINISTRY OF PLANNING & PROGRAMME IMPLEMENTATION

GOVERNMENT OF INDIA

November 1998

PREFACE

The National Sample Survey Organisation (NSSO) in its 52nd round (July 1995 – June 1996) carried out a nation wide survey on social consumption to assess, among other things, the nature and dimensions of the socio-economic problems faced by the aged, i.e. persons of age 60 years and above. The survey also studied the extent of utilisation of facilities in the field of Education and Health. Earlier, a comprehensive survey on the aged was carried out in the 42nd round (July 1986-June 1987).

The present report is on the aged and is based on the “Central Sample” data collected in the 52nd round. Data was collected for the aged on their number of living children, living arrangement, state of economic independence, number of dependants, state of health, disability and their familial roles in the household. Information was also collected on their usual activity, retirement benefits derived, provisions for regular income, etc. Information so collected have been tabulated and presented in this report.

Fieldwork of the survey was conducted by the Field Operations Division. Data scrutiny and tabulation were handled by Data Processing Division. The Survey Design & Research Division was responsible for the designing of the survey and preparation of the report.

I am grateful to the members of the Governing Council and members of the Working Group for their valuable guidance at various stages of the survey work. I also wish to thank the heads of the various divisions of NSSO and their colleagues for their efforts in conducting the survey and bringing out this report. We hope that this report would serve as an important reference document to the policy makers and other users of NSS data.

Comments and suggestions are most welcome.

November 1998

Dr. N.S. SASTRY
Director General &
Chief Executive Officer,
National Sample Survey Organisation

**The Aged in India:
A Socio-Economic Profile, 1995-96**

<i>Appendix : Detailed Tables</i>	A1 - A43

Highlights

- The aged form about 5.5 per cent of the total population of India. The share of the aged, in general, was higher among females than males and was also higher in rural areas than in urban areas.
- The old-age dependency ratio is higher in rural than in urban areas.
- The sex ratio (viz. the number of females per 1000 males) among the aged was 983 during the period 1987-88 to 1993-94 and rose to 1023 in 1995-96.
- The proportion of widows and widowers (58 to 61 per cent) was pronounced among the aged, but declined over time. The decline was sharper among females and in urban areas.
- About 94 per cent of aged persons had at least one surviving child and 6 per cent either never had any child or had children who were not surviving on the date of survey.
- Only 33 (rural) to 35 (urban) per cent of the aged were living without spouse but with their children, 5 per cent were living with other relations and non-relations and 4 to 5 per cent lived alone.
- As many as 70 per cent of the aged had to depend on others for their day-to-day maintenance. The situation is still worse for elderly females. Among them, about 85 to 87 per cent were economically dependent either partially or fully.
- Of the economically dependant aged, 74 per cent had to depend on their children and 14 to 16 per cent on their spouses for their economic support.
- On an average, an aged male had more dependants than an aged female during 1995-96.
- Nearly 40 per cent of the elderly in India were working to earn their livelihood.
- Among the aged who were once employed either as wage/salaried employees or as casual labour, about 79 per cent in the rural areas and 35 per cent in the urban areas did not receive any benefit on their retirement.
- About 54 per cent of the aged had some kind or other of financial assets in 1995-96. The proportion was 8 percentage points lower in 1986-87 in urban areas.
- In the rural areas, about 63 per cent of the aged had some property. The corresponding estimate was 58 per cent for the urban areas.
- The prevalence of chronic diseases among the aged was in general seen to be very high and it was higher in the urban areas (55 per cent) than in the rural areas (52 per cent). ‘Problem of joints’ and ‘cough’ happened to be the most severe diseases for the aged.
- Around 75 per cent of the aged participated in social matters, 80 to 83 per cent in religious matters and about 78 per cent of the aged participated in household chores.

Chapter One

Introduction

1.1 The National Sample Survey Organisation (NSSO), for the first time, conducted a survey on aged persons along with the survey on social consumption in its 42nd round (July 1986- June 1987). The survey was carried out at the instance of the Ministry of Welfare and was aimed to assess the nature and dimensions of the socio-economic problems of the aged, i.e. persons of age 60 years and above. After a gap of almost nine years as a part of the decennial programme of NSS surveys, the survey on social consumption was repeated in the 52nd round (1995-96). In this round, two detailed schedules, other than the schedule on consumer expenditure and employment-unemployment, were canvassed. In one schedule (Schedule 25.2), information relating to participation in education like school attendance, educational benefits received, expenditure made for education, drop-outs, etc. was collected. In another (Schedule 25.0), information was collected on health care. Schedule 25.0 included information on morbidity, utilisation of medical services for treatment of ailments, particulars of pregnancy, death, child care and infant feeding practices, pre-natal and post-natal care and also the problems of aged persons. In fact, the three subjects of 'Maternity and Child Care', 'Utilisation of Medical Services' and 'Problems of Aged Persons' covered separately in the NSS 42nd round were integrated into one schedule in the 52nd round. Thus, the module of information on the aged formed a part of the schedule on 'Survey on Health Care'. Some additional information on

disability, health status, adequacy of food, clothing, etc., was collected in this round and certain information on willingness to move to an old-age home and preference of location of old-age home was dropped. However, the basic concepts, definitions and procedures remained almost the same in both the rounds. The present report is on the aged and is based on the results obtained from the 52nd round.

1.2 In the survey, the data collected for the aged were their number of living children, living arrangement, state of economic independence, number of dependants, persons supporting the aged, disability, chronic ailments, state of health and their familial roles in the household. This apart, the information on usual activity, retirement benefits, provisions for regular income, etc., were collected. Some of these data have been tabulated and presented in this report.

1.3 Two separate samples of first-stage units (FSUs), i.e. census villages in the rural areas and urban blocks in the urban areas, were selected for the survey. One set of sample FSUs, called the Central sample, was surveyed by the NSSO. The other set, more or less on an equal matching basis and known as the State sample, was surveyed by the Directorate of Economics & Statistics of each States and Union Territories. The present report is based on results obtained from the central sample surveyed by the NSSO.

1.4 The number of villages and urban blocks surveyed, the number of households

surveyed and the number of aged persons enumerated in the survey are given (in Chapter 3) separately for rural and urban areas of different States and UTs. It may be seen that the number of aged persons surveyed in smaller States and UTs are not adequate enough to obtain the estimates within the acceptable margin of errors. Thus, the results pertaining to the smaller States and UTs are not presented in this report. However, the all-India estimates are inclusive of all the States and UTs.

1.5 Geographical coverage: The survey covered the whole of the Indian Union

excepting the Ladakh, the Kargil and Doda districts of Jammu & Kashmir, the interior villages of Nagaland situated beyond 5 kms. of a bus route and inaccessible villages of Andaman & Nicobar Islands.

1.6 Layout of the report: After this introductory chapter, some concepts and definitions used in the survey and relevant to this report are discussed in Chapter Two. Sampling design and estimation procedure are given in Chapter Three. Chapter Four gives the main findings of the survey at the all-India level. Detailed tables for the seventeen major States and all-India are given in the appendix to the report.

Chapter Two

Concepts and Definitions

2.1 In the survey, information was collected through the household approach by enumerating all the members of each sample household and recording the particulars for each of them. As usual, a group of persons normally living together and taking food from a common kitchen is taken to constitute a household. Among many other things, usual activity status of each member of the household was recorded. For the aged, particulars of disability, chronic ailment and state of economic independence, etc., were collected. The concepts and definitions used for collecting these items of information are discussed below:

2.2 **Usual activity status:** The usual activity status relates to the activity status of a person during a reference period of 365 days preceding the date of the survey. The activity status on which a person spent relatively longer time (major time criterion) during the 365 days preceding the date of survey is considered the **principal usual activity status** of the person. The broad principal usual activity status will be obtained on the basis of a two-stage dichotomous classification depending on the major time spent. Persons will be classified in the first stage into (i) those who are engaged in any economic activity (i.e. employed) and/or available for any economic activity (i.e. unemployed) and (ii) who are not engaged and not available for any economic activity. In other words, persons will be first classified as those in the labour force and those not in the labour force depending on which of the two

statuses took the person's major time in the year. In the second stage, those who are found in the labour force will be further classified into working (i.e. engaged in economic activity or employed) and seeking and/or available for work (i.e. unemployed) based on the major time spent. Thus the principal usual status will be one of the three: (i) employed, (ii) unemployed and (iii) out of labour force.

2.3 **Visual disability:** Loss or lack of ability to execute tasks requiring adequate visual acuity is considered as visual disability. The visually disabled, for the purpose of the survey, include (a) those who do not have any light perception - both eyes taken together - and (b) those who have light perception but cannot correctly count fingers of a hand (with spectacles/contact lenses in the case of those who are normally using these) from a distance of 3 metres (or 10 feet) in good daylight with both eyes open.

2.4 **Hearing disability:** This refers to persons' inability to hear properly. Hearing disability is to be judged taking into consideration disability of the better ear but without taking into consideration the use of hearing aids (i.e. noting the position obtaining for the person without the aids that may be used).

2.5 **Speech disability:** This refers to persons' inability to speak properly. Speech of a person is judged to be disordered if the person's speech is not understood by the listeners, draws attention to the manner in

which he speaks than to the meaning of what he speaks and is aesthetically unpleasant. Persons with speech disability include those who cannot speak, those who speak only a limited number of words those with loss of voice. It also includes those having speech but with defects in speech such as stammering, nasal voice, hoarse voice, discordant voice and articulation defects, etc.

2.6 Locomotor disability: Locomotor disability means (a) an individual's loss or lack of ability to execute distinctive activities associated with the movement of himself and objects from place to place and (b) physical deformities, other than those involving the hand or leg or both, regardless of whether the same caused loss or lack of normal movement of body. Thus, persons having locomotor disability are (a) those with loss or absence or inactivity of whole or part of hand or leg or both due to amputation, paralysis, deformity and dysfunction of joints and (b) those with physical deformities in the body (other than limbs) which do not affect normal movement, such as hunch back, deformed spine, etc.

2.7 Ailment - illness or injury: Ailment, i.e. illness or injury, mean any deviation from the state of physical and mental well-being. In other words, one is treated as sick if one feels sick. This also includes cases of visual, hearing, speech, and locomotor disabilities. Injuries covers all types of damages, such as cuts, wounds, haemorrhage, fractures and burns caused by an accident, including bites to any part of the body. An ailment may not cause any necessity of hospitalisation, confinement to bed or restricted activity. An ailing member is a normal member of the household who is suffering from any ailment during the reference period. Cases of sterilisation, insertion of IUD, getting MTP, etc., pregnancy and child birth are not treated as cases of ailment. But abortion, natural or accidental, is treated as an ailment. A case of ailment is generally identified with a specific cause and ailments from two different causes are treated as two cases.

2.8 Economic Independence: For the purpose of the survey, a person is considered economically independent if he/she does not require to take financial help from others in order to lead a normal life.

Chapter Three

Sample Design and Estimation Procedure

3.1 Sample Design

3.1.0 General: A stratified two-stage sample design was adopted in this round. The first-stage units were the census villages for the rural areas (panchayat wards in case of Kerala) and the NSSO Urban Frame Survey (UFS) blocks for the urban areas. The second-stage units were the households in both the cases.

3.1.1 Sampling Frame for First-Stage Units (FSUs): The lists of census villages of the 1991 census (1981 census list for Jammu & Kashmir) constituted the sampling frame for the rural areas. For Kerala, however, the list of panchayat wards was used as the sampling frame for the selection of first-stage units in the rural areas. For Nagaland, the villages located within 5 kms. of a bus route constituted the sampling frame, whereas for Andaman & Nicobar Islands, the list of 'accessible' villages formed the sampling frame. For the urban areas, the list of NSSO Urban Frame Survey (UFS) blocks has been used as the sampling frame.

3.1.2 Stratification: For the socio-economic surveys of the NSSO, each State or Union Territory (UT) is divided into one or more agro-climatic regions by grouping contiguous districts which are similar with respect to population density and crop pattern. In Gujarat, however, some districts are sub-divided for the purpose of region formation on the basis of location of dry areas and the distribution of tribal population in the State. In all, there are 78 regions

covering the entire geographical area of the country.

3.1.3 Stratification for Rural areas: In the rural areas, each district within a region was treated as a separate stratum. However, if the 1991 census population of the district was found to be greater than or equal to 2 million (1.8 million population as per the 1981 census for Jammu & Kashmir), the district was split into two or more strata, by grouping contiguous tehsils to form a stratum. In Gujarat, in the case of districts extending over more than one NSS region, the part of a district falling within each NSS region formed a separate stratum.

3.1.4 Stratification for Urban areas: In the urban areas, strata were formed, within each NSS region, by grouping towns on the basis of their population size. The mode of forming the urban strata is indicated in Table 3.1.

Table 3.1: Composition of urban strata in an NSS region

Stratum no.	Population size class (as per 1991 Population Census) of towns
1	all towns with population less than 50,000
2	all towns with population 50,000 - 1,99,999
3	all towns with population 200,000 - 9,99,999
4, 5, .	each city with population 10,00,000 or above

3.1.5 Allocation of First-Stage Units (FSUs): A sample of 13,000 FSUs (rural & urban combined) was selected as the Central sample at the all-India level. The number of FSUs (rural & urban

* 24 nucleus villages.

combined for the Central sample for a State/UT was allocated to its rural and

urban areas considering the relative sizes of the rural and urban populations with double weightage for the urban areas.

The State-level rural sample size was allocated to the rural strata in proportion to their rural population figures as per the census. Similarly, urban sample size of the State/UT was allocated to the urban strata in proportion to urban population figures as per the census. All the stratum-level allocations were adjusted to multiples of 8 as far as possible (otherwise to multiples of 4) in order to allocate them equally in each sub-sample X sub-round combination (2 sub-samples X 4 sub-rounds). The number of first-stage units surveyed for rural and urban areas of each State is given in Table 3.2.

3.1.6 Selection of First Stage Units: The sample FSUs in the rural areas were selected circular systematically with *equal* probability. In the Union Territory of Daman & Diu, the district Diu consists of only two villages. These two were selected for the survey in both the Central and the State sample. Sample blocks in the urban areas were also selected circular systematically with equal probability. Sample FSUs of both the rural and the urban areas were selected in the form of two independent sub-samples. The only departure from the general procedure of selection of FSUs was made for the rural areas of Arunachal Pradesh, for which the procedure of cluster sampling was followed. The nucleus villages were selected circular systematically with equal probability, in the form of two independent sub-samples. A cluster, generally of 4 to 6 villages, was formed around each nucleus village. State/UT - wise number of FSUs actually surveyed is given in Table 3.2.

3.1.7 Selection of Hamlet-Groups/ Sub-Blocks (for 'large' FSUs only): A

large FSU was divided into a suitable number of hamlet-groups/ sub-blocks having equal population contents. Two hamlet-groups were selected from each large FSU in the rural areas and only one sub-block was selected from each large FSU in the urban areas.

3.1.8 Selection of Households (Second-Stage Units): In each of the selected FSUs, three different enquiries, viz. "Survey on Health Care", "Survey on Participation in Education" and "Survey on Consumer Expenditure", were conducted on three independent samples of households. For the present enquiry, i.e. the survey on "Health Care", a sample of 10 households was selected for the detailed enquiry. However, before selection, the listed households were first grouped into two second-stage strata. The composition of the second-stage strata and the number of sample households selected from each of them are shown in Table 3.3. State/UT wise number of households and aged persons surveyed are given in Table 3.2.

3.2 Estimation Procedure

Table 3.3: Second-stage stratum composition and number of households selected

no.	second-stage stratum composition	number of households selected
1	households with at least one of less than one year	2
2	of the remaining households, reporting any case of	2
3	remaining households	6

3.2.0 The notation used for describing the procedure of estimation is given below:

s: subscript for stratum

i: subscript for sample village/block

j: subscript for second-stage stratum of households within a sample village/block

k: subscript for sample household

b: subscript for sub-sample

N_s = total number of villages/blocks in the frame of the s^{th} stratum

n_s = number of villages/blocks surveyed (including uninhabited and 'zero cases' but excluding casualty and other not received cases) in the s^{th} stratum, for any particular schedule type

D = total number of hamlet-groups/sub-blocks formed in the sample village/block

($D=1,4,5,6,\dots$ for rural samples and $D=1,2,3,4,\dots$ for urban samples)

The symbol D' used for the rural areas is described as :

$$D' = D \text{ for } D=1 \text{ and } D' = \frac{1}{2}D \text{ if } D \geq 4$$

H = total number of households listed in the FSU

h = number of households surveyed and used for tabulation

x,y = the two characters (variables) under study

\bar{X}_s, \bar{Y}_s = estimates of population totals of the characters x, y

3.2.1 Estimates of aggregates : The formulae for obtaining \bar{Y}_s , the estimate of aggregate of any character y for the s^{th} stratum, are given below:

Rural:

$$\bar{Y}_s = \frac{N_s}{ns} \sum_{i=1}^{ns} D's_i \sum_j \frac{H_{sij}}{j} \sum_{k=1}^{hsij} y_{sijk} \quad \dots(1)$$

Urban:

$$\bar{Y}_s = \frac{N_s}{ns} \sum_{i=1}^{ns} D's_i \sum_j \frac{H_{sij}}{j} \sum_{k=1}^{hsij} y_{sijk} \quad \dots(2)$$

These formulae were used to obtain sub-samplewise estimates first, and then pooled estimates were obtained as the simple average of the sub-samplewise estimates.

3.2.2 Sub-sample estimates: Sub-sample estimates were computed on the basis of villages and blocks surveyed in the sub-sample concerned. Thus n_s in the above formula denotes the number of surveyed villages/blocks in the sub-sample concerned of the s^{th} stratum.

3.2.3 Combined estimate: The combined estimate based on the whole sample was computed as the simple average of the sub-sample estimates. Thus, if \bar{Y}_{s1} and \bar{Y}_{s2} be the sub-sample estimates of s^{th} stratum total, the combined estimate was obtained as

$$\bar{Y}_s = \frac{1}{2} \sum_{b=1}^2 \bar{Y}_{sb} \quad \dots(3)$$

3.2.4 Estimate of aggregates at State/UT/region level: Let \bar{Y}_b be the estimate of aggregate at State/u.t/region level from b^{th} sub-sample and \bar{Y}_c the combined estimate of aggregate at State/u.t/region level based on the whole sample, then

$$\bar{Y}_b = \sum_s \bar{Y}_{sb} \quad \dots(4)$$

and

$$\bar{Y}_c = \frac{1}{2} \left(\sum_s \bar{Y}_{s1} + \sum_s \bar{Y}_{s2} \right) \quad \dots(5)$$

3.2.5 Estimates of Ratios: If X be the population total of the variable x for the State/UT/region, its estimates \bar{X}_b or \bar{X}_c are obtained in exactly the same manner as above after replacing y by x . Then the estimate of the ratio $R = \frac{Y}{X}$ is obtained

as $\bar{R}_b = \frac{\bar{Y}_b}{\bar{X}_b}$, based on sub-sample b , and

$\bar{R}_c = \frac{\bar{Y}_c}{\bar{X}_c}$, based on the whole sample.

Chapter Four

Main Findings

4.1 As mentioned earlier, the basic objective of the survey was to assess the nature and dimensions of the problems of aged persons, that is, those of age 60 years and above. For that purpose, information on number of surviving children, living arrangement, economic independence, number of dependants, persons supporting the aged, etc., were collected for the aged. The results obtained from the survey are presented in this report. In this chapter, the main findings of the survey are discussed at the all-India level. Similar estimates obtained from the earlier survey carried out during 1986-87 (NSS 42nd round) are also placed side by side, wherever possible, to give an idea about the changes over a period of nine years.

4.2 About 7,663 villages covering 43,076 households and 4,991 urban blocks covering 29,807 households were surveyed in the Central sample, i.e. the sample surveyed by the NSSO. The results presented in this report is based on the Central sample.

4.3 It may be noted that the population estimates obtained from the NSS surveys, in general are found to be lower than those of the census or projections. The differences are mainly due to differences in coverage and methods adopted in the NSS from those of the census operations. In this round, the differences are likely to widen further due to the selection of first-stage units (i.e. villages and urban blocks) with equal probability. However, the ratios obtained from the survey are expected to be much closer to the true ones. Thus, the marginal aggregates of the population presented in the detailed tables of the Appendix may be used only for

combining ratios. The estimated number of persons under any category may be obtained, if required, by applying the relevant survey-based ratios to the projected population.

4.4 Demographic burden: It has been found from the census that the population of the aged in India is rising rapidly. The number of aged persons, which was 43.5 million in 1981, grew to 61.4 million in 1991. But the number of aged persons obtained from the present survey was substantially lower than even that of Census 1991. It was estimated at 46.4 million during 1995-96: about 25 per cent lower than the figure for Census 1991. Among the aged, about 78 per cent were residing in the rural areas and 22 per cent in the urban areas. The survey has also revealed that the aged are concentrated in the rural areas. According to the survey, for every 100 persons living in rural India nearly 6 persons were aged as against 5 per 1000 persons in urban India. This fact is substantiated by the census results given in Table 4.1. The overall share of the aged in the total population in India was 5.5 per cent. Male-female and rural-urban differences in the share are found to exist and the differences are significant. The share of the aged female, in general, was higher than that of the aged male and was also higher in the rural areas than in the urban areas. This fact reflects the higher expectancy of life of females and probably the out-migration of the youth from rural areas. An important phenomenon can be observed that the share of the aged population in the total according to censuses or NSS surveys (except the 52nd round) has

Table 4.1: Share (per 1000) of the aged to total population obtained from NSS surveys and population censuses for each sex

India

source	rural			urban		
	male	female	person	male	female	person
Census 1981	68	68	68	51	58	54
NSS 43rd round (1987-88)	65	66	65	54	61	57
Census 1991	78	74	76	62	66	63
NSS 50th round (1993-94)	68	69	69	55	64	60
NSS 52nd round (1995-96)	55	59	57	47	53	50

increased significantly over the years. According to the census data, the number of the aged was 65 per 1000 persons in 1981 and rose to 74 in 1991. Although, the NSS estimates are lower than those of the censuses, they reveal a similar trend over the rounds, except the present round (NSS 52nd) which shows a decline. In the 52nd round, as the module of information was integrated with the survey schedule on Health Care, a separate design could not be adopted to improve the estimates for the aged. Secondly, there may be under-coverage of the aged due to under-reporting of age.

4.4.1 Old-age dependency ratio: It measures the responsibilities of the aged to the working-age population. In our country, generally, persons aged 15 to 59 years are supposed to form the population of working ages and at age 60, people generally retire or withdraw themselves from work. Thus, the population aged 60 and over divided by the number aged 15 to 59 gives the old-age dependency ratio. The old-age dependency ratios (per 1000) are given in Table 4.1.1. It may be seen that the old-age dependency ratio is higher in rural than in urban areas. According to the census, the ratio has increased over time although the survey

results do not indicate this. This implies that the 'burden' of the aged on the working population is higher in rural areas as compared to that in urban areas and the burden is increasing, according to the census data, over the years.

Table 4.1.1: Old-age dependency ratio (per 1000) obtained from NSS surveys and census

India

source	rural	urban	combined
Census 1981	94	71	89
NSS 43rd round (1987-88)	111	88	103
Census 1991	123	96	118
NSS 50th round (1993-94)	108	90	104
NSS 52nd round (1995-96)	92	74	87

4.5 Sex ratio : According to Census 1981, there were 960 females for every 1000 males of age 60 and above. This number dropped to 930 during 1991. The NSS estimates, on the other hand, show a rising trend. The trend is different in the rural and urban areas. The sex ratio among the aged declined during the period 1987-88 to 1993-

Table 4.2: Sex ratio (number of females per 1000 males) among aged persons obtained from census and NSS surveys

India	rural	urban	combined
source			
Census 1981	954	986	960

NSS 52nd round (1995-96)	1017	1043	1023

94 and rose in 1995-96 in the rural areas (see Table 4.2). In urban areas, the sex ratio increased from 1032 in 1987-88 to 1060 in 1993-94 and then dropped to 1043 in 1995-96. Some studies have pointed out that ‘the elderly population would become more feminine in the future owing to the expected larger increment in the longevity of females’. [Tata Institute of Social Sciences: 1994; see also, Bhat P.N.M.: 1992]

4.6 Marital status: A noteworthy sociological feature of the aged population in India is its heavy concentration in the category of widows and widowers. The elderly persons largely depend on the family for their well-being and economic support. Thus, marital status is an important indicator of their well-being. It is seen from Table 4.3 that the proportion of widows and widowers is pronounced among the aged and is observed to decline over time. The decline is faster among females and in urban areas. Since 1993-94, the proportion of widows dropped by 4 percentage points

in both rural and urban areas and was as high as 58 and 61 per cent, respectively, during 1995-96. The proportion of widowers, on the other hand, was 18 per cent in urban areas and 21 per cent in the rural areas in 1993-94 and there was no substantial change till 1995-96. The never-married persons are perhaps more adversely placed in the society as compared to the widows so far as their well-being is concerned. The never-married, though very small in proportion, form 1 to 2 per cent among the aged in India.

4.7 Aged persons and their surviving sons and daughters : The extended

family system is the dominant form of family in India. In such a system, many of the aged, particularly those who have lost their spouses, depend on their children for maintenance. In Table 4.4, the proportion of aged persons by number of surviving

Table 4.4: Proportion (per 1000) of aged persons by number of their surviving children for each sex

all	58	73	112	942

Note: Figures in parenthesis give the corresponding estimates obtained from NSS 42nd Round (1986-87).

children is given separately for each sex and sector at the all-India level. During 1995-96 in India, about 94 per cent of the aged persons had at least one surviving child. In

other words, about 6 per cent of the aged had no surviving children on the date of survey. The rural-urban differences were negligible with respect to the proportion of the elderly who had surviving children. However, it was marginally higher for males than for females. The results also indicate that since 1986-87, there has been an improvement in regard to the proportion of aged persons having their children alive. The improvement is prominent for males while the proportion remained at a constant level for females.

4.8 Living arrangement: In the survey, besides the number of surviving children, information on living arrangement of the elderly was collected. The results show that, although 94 per cent of the aged had children, only about 33 (rural) to 35 (urban) per cent of the aged were living without their spouse but with their children and about 5 per cent were living with other relations and non-relations (in Table 4.5).

female		121 (88)	146 (137)	706 (775)	1000
person		301 (340)	163 (152)	511 (508)	1000
urban					
male		515 457)	169 (169)	297 (374)	1000
female		115 (48)	110 (91)	757 (861)	1000
person		311 (289)	139 (137)	532 (574)	1000

Note: Figures in parentheses give the corresponding estimates obtained from NSS 42nd Round (1986-87)

Nevertheless, 4 to 5 per cent were living alone. This apart, about 58 per cent of the aged were currently married and most of them (55 to 57 per cent of the aged) preferred to live with their spouses. An interesting gender-differential is observed in the living arrangement among the elderly and the pattern is similar in both rural and urban areas. More males than females lived with their spouses. On the other hand, as compared to the males, proportionately more females lived either alone or with their surviving children or lived with other relations and non-relations. Probably, this pattern is the impact of the higher incidence of widowhood among elderly females than among elderly males. The incidence of widowhood is higher because women live longer. However, the living arrangement appears to have changed over time in a favourable direction since 1986-87. The proportion of the aged living alone came

down from 6 to 9 per cent in 1986-87 to around 4 per cent in 1995-96. The proportion of the aged who lived with their spouses went up significantly from 37 per cent to 57 per cent in the rural areas and 35 per cent to 55 per cent in the urban areas. The decrease in the proportion of aged persons living with their children between 1986-87 and 1995-96 reflects the gradual break-down of the extended family system in India in both its rural and urban areas.

4.9 Economic independence:

The living arrangement describes how the physical well-being of the aged is taken care of in the family in our society.

Similarly, the economic

independence reveals the associated problem of day-to-day maintenance of livelihood of the elderly. The per 1000 distribution of aged persons by state of economic independence is given in Table 4.6 for each sex and rural-urban sectors of India. As many as 70 per cent of the aged had to depend on others for their day-to-day maintenance. The situation is worse for elderly females. Among them, about 85 to 87 per cent were economically dependent either partially or fully. In this respect, males were much better off -- among them 49 to 52 per cent did not depend on others for their livelihood. Compared to 1986-87, the results of the present survey indicate that the economic condition of the elderly in the urban sector has improved whereas it has deteriorated in general in the rural. However, elderly women have progressed economically over time in both rural and urban India, with a faster rate in the urban.

Table 4.7: Per 1000 distribution of economically dependent aged persons by category of persons supporting the aged for each sex

India

sex	category of persons supporting				
	spouse	own children	grand- children	others	total
rural					
male	113 (70)	766 (750)	50 (62)	71 (118)	1000

female	182 (113)	695 (723)	56 (65)	67 (99)	1000
person	156 (90)	728 (749)	55 (63)	61 (98)	1000

Note: 1. Distribution has been obtained from Appendix Table 7 by excluding the n.r. cases.

2. Figures in parentheses give the corresponding estimates obtained from NSS 42nd Round (1986-87).

4.10 Economic support providers:

As has been observed in the earlier paragraph, a large proportion of the elderly are economically dependent on others for their livelihood. It is, therefore, pertinent to know who are the persons providing economic support to these elderly. Such information was collected in the survey and the results are presented in Table 4.7 separately for each sex and sector at the all-India level. It is seen that of the economically dependent aged, a majority (about 74 per cent) had to depend on their children and a sizable proportion (14 to 16 per cent) on their spouses for their economic support. This apart, about 5 to 6 per cent were supported by their grandchildren and the rest (6 to 7 per cent) had to depend on ‘others’, including non-relations. Between the year 1986-87 and 1995-96, the distribution of the aged who were economically dependent changed in respect of the category of persons supporting them for their livelihood. The patterns of change are not similar for males and females, but are so for the elderly living in rural and urban areas. Over the inter-survey period, the proportion of aged males depending on their children for economic support increased while the corresponding proportion of females decreased. However, the proportion of those depending on their spouses, both increased.

4.11 Number of dependants:

For the economically dependent aged, information on category of persons supporting the aged was collected, while for the aged who were economically independent information on the number of their dependants was collected. The results have been presented in Table 4.8 in the form of distribution of

economically independent aged persons by number of dependants. The results are given for each sex and sector of India. It may be mentioned here that a substantial proportion of such aged persons did not report the number of their dependants on them. Although, the ‘not recorded’ cases have been considered for tabulation and given in Appendix Table 6, in Table 4.8 these cases are excluded for obtaining the distribution. It has been observed earlier in this section that about 30 to 31 per cent of the aged were economically independent. Of them, about 95 per cent were reported to be living with one or more dependants. In other words, about 5 per cent had no dependants. The gender differences are quite pronounced in this distribution. The distribution for males appears to have shifted to the right of that for females. This implies that on an average an aged male had more dependants than an aged female during 1995-96. This apart, the pattern appears to be the same for both rural and urban areas.

Table 4.8: Per 1000 distribution of economically independent aged persons by number of dependants for each sex

India sex	number of dependants					
	nil	1	2	3-5	6 or above	total

person	51	416	170	201	162	1000

4.12 In view of the fact that more than two-thirds of the elderly people in our country was dependent on others for their livelihood, the question arises whether they worked to maintain their livelihood and, if not, whether they received any withdrawal or retirement benefits from their past employment. This information was collected in the survey and is discussed below. It may be noted that the usual (principal) activity status approach was followed to identify whether a person was working or not. According to this approach, it is seen that nearly 40 per cent of the elderly in India were working to earn their livelihood. The rest neither did any work nor were available for work as the proportion of unemployed among the aged was virtually nil. The work participation

rate (WPR) and the activity status for the aged are discussed below separately for males and females and separately for the rural and urban areas.

4.13 Work participation rate (WPR):

The WPR and the distribution of workers by activity status are given for the aged at the all-India level in Table 4.9. The WPR among the aged in the rural areas (39 per cent) was nearly double that in the urban areas (21 per cent). The male-female differences were also quite pronounced. In the rural areas, the WPR among the aged females was 17 per cent, and among aged males, the WPR was as high as 60 per cent -- even much higher than that for the

overall population in rural India. In the urban areas, on the other hand, although there was a sharp difference in the WPR between the aged males (35 per cent) and the aged females (8 per cent), the WPR for the aged and particularly for the males was far below the WPR for the overall population. The reason for such a differential phenomenon in rural and urban India could partly be explained by the sector and status of employment. In urban areas, a significant proportion of the working population is engaged in regular wage employment and in this category, generally there is a fixed age of superannuation and people are protected by retirement benefits. In rural areas, on the other hand, the scope of regular

Table 4.9: Work Participation Rate (WPR) among the aged according to usual principal status and their per 1000 distribution by usual (principal) activity status for each sex

male	603 (683)	662 (657)	111 (116)	12 (20)	215 (207)	1000
female	173 (173)	509 (503)	92 (104)	29 (12)	370 (381)	1000
person	386 (433)	627 (626)	106 (113)	16 (18)	251 (243)	1000
urban						
male	353 (429)	176 (177)	567 (575)	147 (140)	110 (128)	1000
female	79 (92)	203 (174)	354 (370)	152 (185)	291 (271)	1000
person	214 (255)	182 (176)	523 (522)	150 (149)	145 (153)	1000

Note: Figures in parentheses give the corresponding estimates obtained from NSS 50th round (1993-94)

wage employment is limited. The rural people mainly engage themselves in the agriculture sector as self-employed. As there is no age limit for superannuation in this category, the people continue to work in their farm and non-farm enterprises even after the age of 60 years. This is also evident from the distribution of workers by activity status given in Table 4.9. Note that the WPR among the aged was lower than

that obtained from the NSS 50th round survey (1993-94). This may be due to the integration of three subjects, viz. Morbidity, Maternity & Child care and Problems of the Aged, into one schedule and, therefore, lack of deep probing for identification of workers. However, the results obtained from the two surveys corroborate each other in respect of the pattern and the distribution by status.

Table 4.10: Number of aged persons who were ever employed but not employed preceding the date of survey per 1000 aged persons for each sex

<i>India</i>		no. (per 1000) of aged persons ever employed	distribution by status of last employment	
sex	self- employed		regular employees / casual labour	
rural				
male	959	586	414	
female	362	562	438

urban				
male	982	332	668	
female	189	427	573	
person	507	353	647	

4.14 It has been observed that among the aged, more than 60 per cent in the rural areas and about 79 per cent in the urban areas neither did any work nor were available for work during 1995-96. In fact, they were out of the labour force. They were mostly engaged in household duties or were receiving remittances, pensions, etc. Among these aged people, about 51 to 55 per cent had worked some time in the past (see Table 4.10). In the rural areas, about 58 per cent of them had worked as self-employed and the rest as regular wage earners or casual labour. The corresponding percentages were 35 and 65, respectively, in the urban areas. The rural-urban differences in the distribution by status reflect the impact of existing differences in the distribution of workforce in these sectors.

4.15 Retirement benefits received: For the aged persons who were ever engaged in either wage/salaried job or as casual labour,

Table 4.11: Per 1000 distribution of aged persons who were ever engaged in wage/salaried job or as casual labour but were not employed preceding the date of survey by type of retirement benefits for each sex

sex	type of retirement benefits				total
	pension only	pension with other benefits	no pension but with other benefits	no benefits	
rural					
male	99	157	69	675	1000
female	26	18	28	928	1000
person	67	93	50	790	1000
urban					
male	171	372	189	268	1000
female	5	153	98	674	1000
person	151	328	171	350	1000

the information on benefits received by

them in the event of their retirement from the job was collected. The information so obtained are presented in Table 4.11 in the form of distribution of these persons by type of benefits received, separately for each sex and separately for the rural and urban sectors at the all-India level. It is important to note that for about 21 per cent of this category of aged persons in the rural areas and 26 per cent in the urban areas, information on benefits could not be collected. These cases are excluded from the distribution given in Table 4.11. It is seen that among this 'category' of aged persons who were once employed either as wage/salaried employees or as casual labour, as many as 79 per cent in the rural areas and 35 per cent in the urban areas did not receive any benefit in the event of their retirement. Such a rural-urban difference may be due to the larger share of casual labourers in this 'category' in the rural areas than in the urban areas and to the casual labourers being generally deprived of retirement benefits.

Further, because of similar reasons, a large difference in the proportion of 'non-beneficiaries' is observed between males and females. This apart, in the rural areas every sixth aged person who retired from wage/salaried job or as casual labour was receiving pension, whereas in the urban areas, every second aged person was fortunate to receive pension.

4.16 Ownership and management of financial assets and property: Information pertaining to ownership of financial assets and property and its management was collected for all the aged persons. For the survey, management was defined as involvement in making decisions to change

the portfolio of the assets held or to convert its form. The results obtained from the survey are given in Table 4.12 for each sex

Table 4.12: Number of aged persons having financial assets/property per 1000 aged persons for each sex

India sex	having financial assets		having property	
	and managing	all	and managing	all
	rural			
male	569 (450)	695 (581)	651 (639)	804 (819)

female	185 (114)	376 (371)	206 (167)	420 (481)
person	379 (283)	535 (462)	401 (388)	578 (611)

Note: Figures in parentheses give the corresponding estimates obtained from NSS 42nd round (1986-87)

at the all-India level. About 54 per cent of the aged had some kind of financial assets in 1995-96. The proportion was 8 percentage points lower in 1986-87 in urban areas. But it was the same in rural areas in both 1986-87 and 1995-96. On the other hand, the proportion of the aged reported to have property has declined substantially over the period from 1986-87 to 1995-96. In rural areas, it was 75 per cent in 1986-87 but came down to 63 per cent in 1995-96. The corresponding estimates for these two time points were 61 and 58 per cent for urban areas. The sharp fall in the proportion for the rural areas may be due to the fact that over the years, the number of landless and marginal farmers has increased owing to continuous fragmentation of land, and land

happens to be the main source of income and property. It may be further noted that not all of those who have either financial assets or property, are involved in their management. Around 37 to 38 per cent of the aged had financial assets and were also involved in taking decision to convert them from one form to another. In the case of property, the proportion was 43 per cent in rural areas and 40 per cent in urban areas. Moreover, there has been an improvement over the period from 1986-87 to 1995-96, except for the management of property in

these are given in Table 4.13 separately for aged males and aged females and for rural and urban India. The prevalence of chronic diseases among the aged was in general seen to be very high and it was higher in the urban areas (55 per cent) than in the rural (52 per cent). ‘Problem of joints’ and ‘cough’ happened to be the most severe diseases for the aged. ‘High or low blood pressure’ came next in the order of severity.

It has been mentioned earlier that the module on the aged was integrated with the

Table 4.13: Number of aged persons reporting a chronic disease per 1000 aged persons by type of chronic disease for each sex

any of the above	527	514	520	528	560	545

the rural areas. In all other cases, participation in managing the financial assets or property has increased substantially.

4.17 Health status: Among other things, information on some chronic diseases and physical disabilities was collected for the aged. These are discussed below.

4.17.1 Chronic ailments: Among the aged, prevalence rates (per 1000) were obtained for some specified chronic ailments and

schedule on ‘Health Care’. In the schedule, information on morbidity was collected in detail for each household member irrespective of age. In the module for the aged, information on some specific chronic diseases was also collected separately. It appears from the results that for the survey on aged persons, the strict definitions and procedures were not followed to identify the chronic diseases. Perhaps, a ‘usual health status’ concept had been followed. That is, if one had suffered from any of the specified chronic diseases any time in the past, he/she

had also been considered to be suffering from that chronic disease irrespective of whether or not he/she was suffering from the chronic disease on the date of the survey. The idea was that some of the chronic diseases could be controlled but might not be cured.

4.17.2 Physical disability : The prevalence (per 1000 person) of various physical disabilities, viz. visual, hearing, speech and locomotor, among the aged are given in Table 4.14 for each sex at the all-India level. The corresponding estimates obtained from the last survey on disability (NSS 47th round : July-Dec. 1991) have also been given side by side. It is seen that the two sets of estimates are quite divergent, although the same concepts and definitions were followed in these two rounds. The

rates for the current round are much higher than those of the 47th round. Perhaps, the procedures followed, particularly the probing, for identifying persons with disability were not the same. In this round, since multiple subjects were integrated in one schedule and the main focus of the survey was on morbidity in general, informants' perception about disability seems to have been recorded in the schedule without deep probing -- the reason why the estimate of prevalence rate of various disabilities among the aged are found inexplicably high. It may be noted that survey on physical disability was also carried out in the 36th round (July-Dec., 1981) and the estimates obtained from that round closely compare with those from the 47th round.

4.18 Familial integration : Information on participation of aged persons in some specific activities was collected. These were activities relating to social matters, religious matters and household chores. Number of aged persons participating in these activities are given in Table 4.15 at the all-India level. Around 75 per cent of the aged participated in social matters, 80 to 83 per cent in religious matters and about 78 per cent of the aged participated in household chores. Between 1986-87 and 1995-96, participation in social matters and religious

matters has increased for both the sexes. In the case of household chores, while the participation decreased particularly in the rural areas, the rate for the aged females seems to have increased substantially between the two surveys.

*Table 4.14: Prevalence rate (per 1000 persons) of physical disability among aged persons by type for each sex

Amendments for NSS Report No. 446 (52/25.0/3)

In Table No. 2 of Appendix at pages A-5 to A-7 :

1. The last 3 rows of the tables pertain to persons of all ages and hence the phrase '(all ages)' should be read against each of the last three rows after the stub (row description) for these rows as, All-India (all ages), estd. persons (00) (all ages), sample persons (all ages).
2. One row giving the **distribution (per thousand) of the aged by marital status (proportions) for all-India** (which was missed out earlier from the tables) is to be inserted just below the row for 'West Bengal' for each of the six (6) category tables under Table 2. The details of the row to be incorporated in these tables is given below:

All-India: Distribution of the aged by marital status

category	marital status					aged persons
