Sampling

Sampling Procedure

Basic sample design was stratified two stage with census villages and urban blocks as the first stage unit in rural and urban sectors respectively and house holds as the second stage units in both sectors.While the villages were selected with probability proportional to population with replacement, the sample blocks were selected by simple random sampling without replacemet (both in the form of two independet sub samples). The househlds listed in the sample villages or block divided in to two sub-strata; sub-stratum-1 consisting of households with one or more members enrolled at post-primary level,and sub-stratum- 2 of all the remaining households.These sample households were selectted circular systematically with the the random start from each sub-stratum (six households in all)

In the absence of an electronic/hard copy of the 'Sampling design and estimation procedure' details could not be provided

Deviations from Sample Design

There was no deviation from the original sampling design

Weighting

Sample weights were calculated and included in each of the data files
Multipliers for Sub-stratum -1, sub-stratum-2 and Combined have been computed and posted in the data.

Variable 'Wgt_SS' refers to Multiplier for each Sub-Sample.
Variable 'Wgt_Combined' refers to Combined Multiplier.

Directory file and its layout are in the External Resources.

Data Processing

Data Editing

Data was collected as per the Questionnaire 27. For processing purposes, a flat file was created using the identification particulars from Block 1 and other common information posted in each record of the data along with the multiplier for estimation. Data editing, scrutiny and validation were carried out as per the scrutiny checks and corrected manually.

Other Processing

Note: While creating metadata, many items from the record layout has been dropped such as Fillers and items which were generated internally for tabulation purposes. There is no documents available on these items as well.
